Climate Change, the Indoor Environment, and Health is written primarily for the EPA and other federal agencies that may be affected by climate change. Although the focus of the book is on climate change, the potential impacts on the indoor environment and the resulting health effects are discussed. The book finds that steps taken to mitigate climate change may cause or exacerbate harmful indoor environmental conditions. The book discusses the need for a comprehensive approach to address indoor environmental issues and to ensure the health and well-being of building occupants.

Indoor air pollution is a complex problem that affects human health and the environment. The book reviews the etiology of diverse human diseases and provides an overview of our current understanding of air pollution health risks and how this knowledge is being used in the regulatory, therapeutic intervention, and preventive measures to protect public health.

The book also provides guidelines on how to protect the public health and reduce the disease burden caused by acute and long-term exposure to air pollutants. The book covers the modelling of air quality, air pollution control, air pollution engineering/atmospheric chemistry, exposure to ambient air pollutants, both indoors and outdoors, and how this knowledge is being used in the regulatory, therapeutic intervention, and preventive measures to protect public health and reduce the disease burden caused by acute and long-term exposure to air pollutants.

The book is a comprehensive guide to understanding air pollution health risks, morbidity, and the global disease burden, whilst also delivering critical review on state-of-the-art research so as to gain a fundamental understanding of the biological mechanisms involved. The book is a valuable resource for professionals in the field of environmental health and those interested in understanding the impact of air pollution on human health and the environment.
